 FILE: The Second All-Union Conference on Radioelectronics of the Ministry of Higher Education of the USSR (Vtoraya Vsesoyuznaya konferentsiya MFO SSSR po radioelektronike)

Po Krovskiy L.D.

EDITORIAL: Radiotekhnika i Elektronika, 1958, Vol. 3, No. 3,
 pp. 440 - 444 (USSR)

ABSTRACT: The conference took place during September 23 - 29, 1957 at Saratov University, Saratov, Soviet Union. A.G. Chernyshhevskiy (Saratov State University Head, Ukrainian Academy of Science), V. I. Lopukhin, N.D. Derjakhov presented numerous scientific papers. The discussion and evaluation of the papers presented and the determination of plans for the future research to be carried out by the universities in the field of radioelectronics.

During the Plenary session September 25, two papers were read: "Development Trends of U.H.F. Electronics in the Soviet Union" by N.D. Derjakhov and "Electromagnetic fields in the Systems of Uni-directional Electron Beams" by V.M. Lopukhin. N.D. Derjakhov presented numerous factual data illustrating the rapid development of U.H.F. electronics in the Soviet Union and the great contribution of Soviet scientists to the theoretical foundations of this science. He also discussed the development trends of U.H.F. electronics in the immediate future. The paper described a number of original Soviet U.H.F. devices. The work of V.M. Lopukhin was concerned with the theoretical investigation of the phenomena taking place in multi-ray devices whose electron beams have different directions. The author showed that the presence of the electron beams which are perpendicular to the axis X facilitates the appearance of the solutions which are increasing functions of X for the case of n rays. The appearance of exponentially increasing solutions in the presence of one beam in the above direction. The electrons were concerned with the theoretical and experimental investigation of wide-band electronic devices for U.H.F. The lecture by V.N. Shevchik, L.I. Matovs and L.D. Potochnik dealt with the extension of the known theories of travelling-wave tubes and backward-wave tubes to the travelling-wave tubes and backward-wave tubes to the travelling-wave tubes. The delay structure necessitated taking into account the discrete character of the interaction of the electron beam with the high-frequency field. The lecture by V.G. Stal'makhor, V.M. Shevchik and Yu. N. Zhdanov was devoted to the simplified analysis of the operation of a backward-wave tube by employing the conicaloidal approximation of the given field. The papers by V.P. Brusilovsky, A.I. Korshakov, A.I. Kositsynko, G.P. Lyubimov, I.T. Trofimov and V.V. Andreev were concerned with the detailed experimental and theoretical investigation of the possibility (first indicated by V.M. Shevchik in 1954) of expanding the bandwidth by mutual synchronization of neighboring klystron tubes. The operation of reflex klystrons with multi-circuit resonant systems was also investigated. The results of experimental and theoretical investigation of two-ray amplifying and multiplying tubes were given in the communication by L.Z. Lebedeva, N.M. Lopukhin, L.A. Shukova and in the communication of V.I. Kachava. Some of the papers in the Macrotubes Section dealt with the investigation which were concerned with the development of novel U.H.F. forms in the millimeter and sub-millimeter ranges. The papers of great interest were: "Experimental investigations of the Radiation Runshe in the VHF range" and "Investigations of Non-homogenities by V.B. Brusilovsky and T.A. Sosina".

Concerning the efficiency of General Methods of the Generation of Millimeter Waves" by A.S. Tager and "Application of the High-Spatial Harmonic Magnetic Field in Slow-down Systems" by A.G. Tager and V.A. Solntsev.

TITLE: Synthesis of phosphor-containing polyesters and their application in preparation of fireproof polyurethane foams

SOURCE: Plastichekiye massy, no. 2, 1966, 10-11

TOPIC TAGS: polyester plastic, polyurethane, foam plastic, fire resistant material, phosphorous acid, esterification

ABSTRACT: Polytransesterification of dimethylphosphorous acid (I) with polyols (pentaerythritol, trimethylolpropane, trimethylethane) or of mixed polyols and diols in various ratios, has been investigated. This work is a continuation of a study of polyphosphite synthesis by V. I. Kirilovich, I. K. Rubtsova, and Ye. L. Gefter (Plast. massy, No. 7, 20, 1963), and was undertaken to test the suitability of polyesters in imparting fire-resistant properties to polyurethane foams. Reaction of the mixture of diols and polyols with I yields polyesters

Card 1/2

L 20806-66

ACC NR: AP6005945

having viscosities similar to those of the polyurethane foams, i.e., $\eta^{25^\circ} \leq 1000$ poise. The optimal ratio of viscosity and free hydroxyl groups in polyphosphites occurs with pentaerythritol:hexane-diol = 0.3:0.7 and pentaerythritol:diethylene glycol = 0.2:0.8. Of all polyphosphites obtained with individual polyols, poly-trimethylolpropane phosphite had the most acceptable viscosity. The use of metallic sodium as a catalyst permitted lowering of the initial reaction temperature, thus preventing excessive rise of the viscosity of the product. The resulting phosphor-containing polyurethane foams were self-extinguishing and thermally stable. Orig. art. has: 3 tables.

AUTHORS: Shevchik, V. N. and Pokrovskiy, L. D.TITLE: Energy Exchange in the Discrete Interaction of Electrons
with a Travelling Electromagnetic WavePERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Radiofizika,
1960, Vol 3, Nr 1, pp 155-158 (USSR)ABSTRACT: The analysis of the energy exchange between electrons
and electromagnetic waves propagated in a periodic struc-
ture can be carried out by considering the discrete
interaction of the electron current with a succession of
high frequency fields separated by field-free gaps
(Ref 1). In a previous paper (Ref 1) an analysis was
given of the cascade interaction between electrons and
a constant amplitude wave, assuming that the transit
angles through the interaction regions are small. The
present paper extends this analysis to the case where the
ratio of the length of the high frequency regions to the
length of the field-free gaps is arbitrary. The
following simplifications are made:

Card 1/3 1) Standing electromagnetic fields are set up in the ✓

Energy Exchange in the Discrete Interaction of Electrons with a Travelling Electromagnetic Wave

interaction regions (outside the field-free gaps) and the amplitude is the same for all these standing waves; 2) the amplitudes of the high frequency fields in the gaps are small; 3) in assuming the effect of the high frequency field on the electron current the effect of the electron current on the field of the system is expressed in terms of the energy interaction only; the change in the distribution of the electromagnetic field in the system as a result of this interaction is not considered (the "given field" approximation).

Integration of the equation of motion of the electron under the above assumptions leads to Eq (1) which gives the velocity of the electron at a general point x in the k -th gap. The transit angle in the region between the $(k-1)$ -th and the k -th high frequency gaps is given by Eq (3). The total electron transit angle for the

Energy Exchange in the Discrete Interaction of Electrons with a Travelling Electromagnetic Wave

entire system is given by Eq (4) and using this equation and the fact that the charge must be conserved the bunched current is given by Eq (5). Finally, the average interaction power is given by Eqs (6) to (8). The analysis is then applied to a number of special cases.

TITLE: Estimate of the Role of Space Charge in Kompfner's
BWT-Theory

PERIODICAL: Radiotekhnika i elektronika, 1960, Vol 5, Nr 6,
pp 1008-1010 (USSR)

ABSTRACT: Kompfner's method of successive approximations is
distinguished by greater simplicity than other theories.
However, he neglects the electron beam space charge.
Correction for this is analysed in the present paper
and it is shown that the results agree well with those
obtained by Heffner using self-matched solutions.

TITLE: Low-pressure polyethylene filters

SOURCE: Plasticheskiye massy, no. 7, 1963, 64-65

TOPIC TAGS: filter, polyethylene, polymer, polyvinylchloride, Vinyon, compression strength

ABSTRACT: Authors present a generalized survey of polymers which can be used for filters. The most extensively developed are filters made out of polyvinylchloride and polyethylene. This is due to their high operating properties and low cost of raw materials. The use of polyvinylchloride filters is limited by the material's thermostability. These filters can be used up to a temperature of +60 C. High-density polyethylene filters can operate at higher temperatures (up to 100C). Vinyon is described briefly [Abstractor's note: this name is misspelled in the original.] Production of polyethylene filters is described. Authors produced low-pressure polyethylene filters with NaCl as filler. Method described is simple and practi-

Card 1/2

cal for the production of fine-pore, low-pressure polyethylene filters. Indices such as weight by volume, pore size, compression strength, hydrostatic pressure strength and filtering rate attest to the fact that polyethylene filters can be successfully used in place of the more common filter materials.

TITLE: Rigid polyurethane foams based on simple polyethers
15 ↴

SOURCE: Plasticheskiye massy, no. 6, 1966, 59-61

TOPIC TAGS: isocyanate resin, polyurethane, foam plastic, organic oxide, surface active agent, heat resistance

ABSTRACT: The effects of different components on the 1-stage preparation and the properties of rigid polyurethane foams based on simple polyethers were investigated. Physical-mechanical properties of polyurethane foams based on the addition products of propylene oxide [to glycerin] xylitol or sorbitol were essentially the same; when a polyether made of saccharose was used, the indices were higher. Little difference in physical properties was noted with change in the component isocyanate or change in catalyst. The latter affected reaction time only, variations from 69-755 seconds were obtained with different tertiary amines, and a much more limited range of 50-80 seconds was obtained with organotin catalyst.

1
Of various surface active agents, only the block copolymer of polyglycol and silicone gave a foam with more uniform and finer structure. There was little difference in properties of products obtained with polydimethylsiloxane PMS-15, 40, or 60 as surfactants; PMS-200 and 300 caused the foam to break down. Of the foaming agents tried, water gave a product with higher heat stability. Glycerin had to be added when various freons were used in order to prevent settling; the foams then had higher indices than when freons were used alone. Too much settling occurred with methylene chloride as foaming agent, even with the addition of glycerin. Orig. art. has: 6 tables.

TITLE: Polymers - Into the Soil (Polimery - v pochvu)

PERIODICAL: Nauka i zhizn', 1959, Nr 2, p 68 (USSR)

ABSTRACT: This article recommends the use of synthetic resins for the stabilization of soils and ground, the fight against erosion, and the alteration of other soil qualities. The use of chemical preparations as molten sulphur, cement, iron salts, calcium, magnesium etc. is not economical in view of the large quantities of these materials needed in each case (10-15% of the weight of the soil). Polymers however, to be used for the stabilization of the soil, can be introduced in smaller quantities (1-0.01%). New preparations useful for the treatment of the soil are silico-organic compounds, anilinoformaldehyde resins and, par-

Card 1/2

SOV/35-59-2-29/48

Polymers - Into the Soil

ticularly, acrylic compounds polymerizing in the soil. Calcium acrylate appears to be a very good stabilizing agent. This monomer in powder form easily dissolves in water. If a catalyst (ammonium persulphate) is added to the solution, polymerization begins at very low temperatures (near zero). The efficiency of calcium acrylate is based on the ion exchange of calcium with ions contained in the particles of the soil and subsequent polymerization of the acrylate molecule. Copolymers are also valuable for changing the quality of the soil.

TITLE: A Thermic Method of Boring Hard Rocks
sob bureniya krepkikh gornykh porod) (Termicheskiy spo-

PERIODICAL: Gornyy Zhurnal, 1958, Nr 6, pp 41-44 (USSR)

ABSTRACT: The Moskovskiy gornyy institut (Moscow Mining Institute) and the Khar'kovskiy aviatsionnyy institut (Khar'kov Aviation Institute) are working on the creation of a drilling bench for the thermic boring in extra-hard rocks. This method consists of the following operations: In the rocket-type combustion chamber, a mixture of kerosene and oxygen is ignited. The gas stream (of a very high temperature) passes through the nozzle of the burner at supersonic speed and heats the rock. Owing to bad heat conductivity the rock is not equally heated, thermic stress is formed and the rock breaks. The chipped-off particles are ejected from the bore-hole by the gas stream. The advancing bore rod by its speed regulates the dimension of the hole. The Khar'kov Aviation Institute created such a bench STB-1, mounted on the chassis of ZIS-150 motorcar. A detailed description is given. It was found that this type of drilling bench was suitable for boring in granite rocks

ABSTRACT: Pokrovskiy, N., Deputy Director

TITLE: On the Way of Automation

PERIODICAL: Radio, 1959, Nr 8, pp 5-6 (USSR)

ABSTRACT: This article deals with the introduction of automation at several radio and electronic equipment plants of the Mosoblsovnarkhoz. One of these plants is producing the TV set "Start-2" which is composed of three printed circuit panels containing the horizontal and vertical sweep units, the IF and LF amplifiers and the video amplifier. Plant employees have designed automatic machines for pressing the panels of K21-22 powder, producing printed circuits, performing soldering and varnishing operations. An automatic furnace was built for relieving internal stresses in printed circuit panels. The application of printed circuits permitted not only the utilization of automatic machinery, but also simplified tuning operations and reduced the weight and power consumption of the

On the Way of Automation

Card 2/3

TV set. Although the "Start-2" is equipped with a 220x290 mm picture tube, its weight is only 20 kg and the power consumption is 130 watts. The TV set "Luch", which has only a 180x240 mm picture tube, has a weight of 40 kg and a power consumption of 210 watts.- At the Pavlovo-Posadskiy elekromekhanicheskiy zavod (Pavlovskiy Posad Electrical Equipment Plant) employees designed about 100 different types of automatic devices and manufactured more than 500 automatic units. Mechanized conveyer lines were set up for the manufacture of paper and mica capacitors. About 60 workers were replaced by one 33m long automatic line producing 300,000 capacitors per shift, which is now operated by three people from one control panel. Recently, plants of the Mosoblsovmarkhoz started the production of 10-15 kw semiconductor devices made of single silicon crystals. These

Translation from: Referativnyy zhurnal. Elektrotehnika, 1959, Nr 2, p 265 (USSR)

AUTHOR: Pokrovskiy, N. B.

TITLE: Speech Intelligibility Under Various Acoustical Conditions and a Basic Method for Computing It (Razborchivost' rechi v razlichnykh akusticheskikh usloviyakh i osnovy metodiki yeye rascheta)

PERIODICAL: Sb. Vospriyatiye zvukovykh signalov v razlichnykh akusticheskikh usloviyakh. M., AS USSR. 1956, pp 57-68

ABSTRACT: Articulation is the most objective criterion for evaluating the quality of speech transmission by telephone and radio-telephone equipment. Measuring articulation by special crews of operators is a cumbersome process. Fortunately, articulation can be not only measured but computed analytically. The problem of computing articulation includes establishing relations between the unknown articulation value and the known electroacoustical parameters of the channel, speech and hearing characteristics, and noise level. The

Speech Intelligibility Under Various Acoustical Conditions and a Basic Method

connections between these quantities can be determined objectively through existing laws of perceiving speech sounds by the human hearing organs. Methods for computing articulation of the English language were developed by a number of authors since 1929. These methods in their most complete shape were developed for the Russian language by the Chair of Telephony, Voyennaya Akademiya Svyazi (Military Academy of Communications), in 1949 -1953. The essence of the above methods is described, and all characteristics required for computing Russian speech are presented. In addition, peculiarities of computing are indicated when a strong noise up to 130 db affects the listener. It is demonstrated that in this case, the following factors need to be taken into consideration: (1) increase in the total speech level (formants); (2) deforming the frequency spectrum when forcing speech; (3) increase in the spread of audibility thresholds of receiving operators; (4) certain variations in noise-masking laws; (5) deafening phenomenon due to loud speech received.

Speech Intelligibility Under Various Acoustical Conditions and a Basic Method . . .

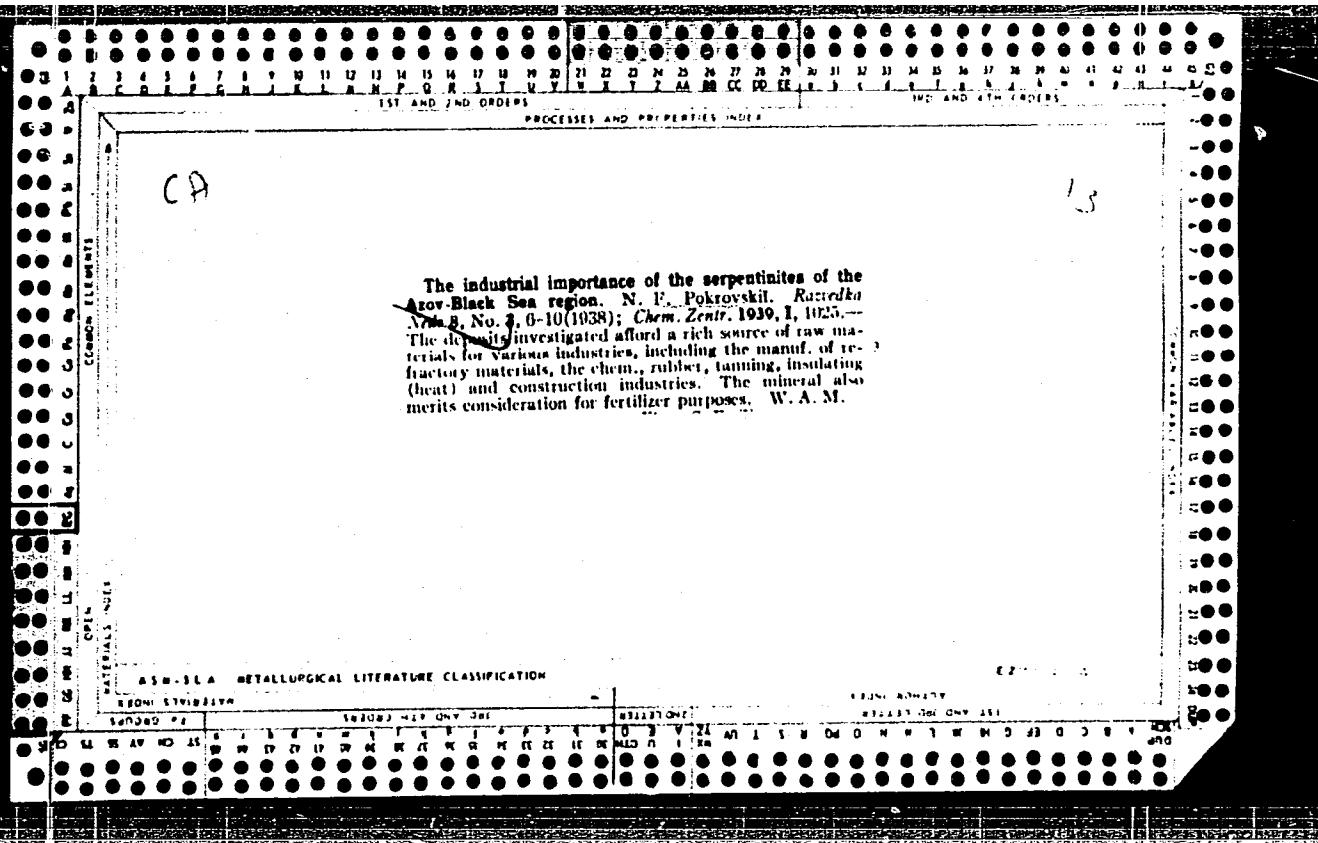

Formulae and graphs allowing for the above listed factors are given. In the case of channels with laryngophones instead of microphones, it is recommended that the laryngophone output characteristics be used in the form of equivalent microphone characteristics.

TITLE: A method for producing insulating plastics Class 39, No. 169246

SOURCE: Byulleten' izobretений i tovarnykh znakov, no. 6, 1965, 61

TOPIC TAGS: plastic insulator, polar polymer, nonpolar polymer

ABSTRACT: This Author's Certificate introduces a method for producing insulating plastics based on polyvinylchloride modified with rubber. The electrical insulation properties and heat resistance of the product are improved by using a mixture of polar and nonpolar rubbers as the modifiers with the addition of mineral fillers.

Properties of metallic solutions. II. Surface tension of amalgams. B. P. Bering and N. L. Pokrovskii. *Acta Physicochim. U. R. S. S.* 4, 601-72 (1930) (in English).—A method is elaborated for measuring the surface tension of amalgams by observing the max. pressure of drops *in vacuo*. This method yields a value of 410 dynes/cm. for the surface tension of Hg. The method of max. pressure of bubbles in an atm. of H₂ gave a value of 465 dynes/cm. for Hg. The surface tension of amalgams of Cs, Rb, K, Na, Li, Ba, Sr, Mg, Pb, Sn, Cu, Ag, Cd, Bi, Co and Zn was measured within the range of concns. of 0-0.2%. The results will be given later. H. G.
